Is aisleflow better? One cell per rival per map

Each cell is aisleflow's throughput divided by that rival's on that map: above 1.00x aisleflow delivers more, below 1.00x it delivers less.
Against both published baselines aisleflow wins everywhere by 13x to 315x. Against the plain PIBT it extends it is ahead on the two aisle-constrained maps and behind on the two open ones -- and at five seeds only the two losses clear $p < 0.05$.

	plain lifelong PIBT	Token Passing	Token Passing + recovery	RHCR
bottleneck aisle-constrained	**1.22x** **aisleflow ahead** 155 vs 127 per 1000 steps p = 0.008	**21x** **aisleflow ahead** 155 vs 8 per 1000 steps p = 0.008	**16x** **aisleflow ahead** 155 vs 10 per 1000 steps p = 0.008	**13x** **aisleflow ahead** 155 vs 12 per 1000 steps p = 0.008
corridors aisle-constrained	**1.39x** **aisleflow ahead** 181 vs 130 per 1000 steps p = 0.008	**delivers nothing at all** **aisleflow wins** 181 vs 0 per 1000 steps p = 0.008	**delivers nothing at all** **aisleflow wins** 181 vs 0 per 1000 steps p = 0.008	**362x** **aisleflow ahead** 181 vs 0 per 1000 steps p = 0.008
narrow open floor	**0.87x** **aisleflow behind** 309 vs 354 per 1000 steps p = 0.016	not run on this map	not run on this map	not run on this map
medium open floor	**0.85x** **aisleflow behind** 426 vs 502 per 1000 steps p = 0.008	**106x** **aisleflow ahead** 426 vs 4 per 1000 steps p = 0.008	**53x** **aisleflow ahead** 426 vs 8 per 1000 steps p = 0.008	**29x** **aisleflow ahead** 426 vs 14 per 1000 steps p = 0.008
